## UNIFIED ID

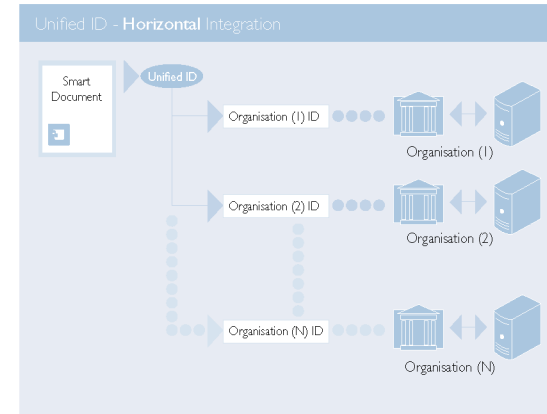

Unified ID Solution – speeding up the transition to e-government

Amricon's highly innovative Unified ID solution is designed to aid governments in their transition towards full e-government. It does this by speeding up and simplifying vertical and horizontal integration. The sharing and transfer of information across heterogeneous IT environments facilitates speedier introduction of G2G, G2B and G2C services.

### How Unified ID solution works – horizontally

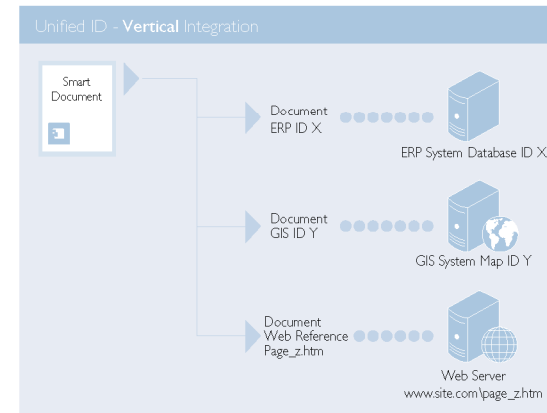

The Unified ID concept is the solution to the problem of having different "IDs" or reference numbers issued every time an individual or business carries out transactions within different government organizations. The big benefit of Unified ID is that it enables these separate IDs to be linked to a master ID.

A good example of how integration can be carried out between different government organizations by utilizing the existing infrastructure.

### How Unified ID solution works – vertically

Within a single government department, many different IT systems are in use. For example, there could be a GIS, a ERP and a Document Management System. An employee may have maps on the GIS system, transactions on the ERP under a different number, as well as several documents under the Document Management System using yet a third number. Amricon's Unified ID solution helps to avoid this bureaucratic nightmare by linking all these different numbers to a single master number. Once again, integration can be carried out by utilizing existing infrastructure.

### The benefits of Unified ID

- Speeds up and simplifies e-government vertical and horizontal integration
- Facilitates information sharing and transfer across IT environments
- Faster introduction of G2B AND G2C services
- Can be carried out utilizing existing infrastructure
